

is a collection of morphisms  $\eta_x$  indexed by objects  $x$  in  $\mathcal{C}$

$$(\eta_x : F(x) \rightarrow G(x))_{x \in \text{obj}(\mathcal{C})}$$

such that

(i) for each object  $x$  in  $\mathcal{C}$ ,

$\eta_x$  is a  $\mathcal{D}$ -morphism from  $F(x)$  to  $G(x)$ ;

(ii) for every morphism  $f : x \rightarrow y$  (i.e.  $f \in \text{Hom}_{\mathcal{C}}(x, y)$ ),

$$\begin{array}{ccc} F(x) & \xrightarrow{\eta_x} & G(x) \\ F(f) \downarrow & & \downarrow G(f) \\ F(y) & \xrightarrow{\eta_y} & G(y) \end{array} \quad \left( \begin{array}{l} \rightarrow \text{This is called} \\ \text{naturality} \\ \text{condition} \end{array} \right)$$

⑦ One intuition is that  $F$  and  $G$  are type constructors and  $\eta$  is a polymorphic function from  $F$  to  $G$ . Whenever we are given a type  $x$ , we have an instantiation of  $\eta$  at  $x$  that is a function from the type  $F(x)$  to the type  $G(x)$ .

The condition (i) says that  $\eta$  should typecheck. The condition (ii) says that ~~what~~ what  $\eta$  does at  $x$  should be identical in a sense to what it does at  $y$ . In other words,  $\eta$  should not depend much on its type parameter  $x$ . This is called uniformity.

⑧ Here are a few examples:

$$\text{unit} : \text{Id} \xrightarrow{(-)} \perp : \text{Predom} \rightarrow \text{Predom}.$$

$$\text{unit}_P \in [P \rightarrow P_{\perp}]$$

$$\text{unit}_P(x) = x.$$

Let  $\text{fst}$  be ~~a~~ <sup>objects of categories</sup> a functor from  $\mathcal{C} \times \mathcal{D}$  to  $\mathcal{C}$ , defined by

$$\text{fst}(x, y) = x$$

$$\text{fst}(f, g) = f.$$

Then,

$$\pi_0 : \mathcal{C}(x, -) \xrightarrow{\cdot} \text{fst} : \text{Predom} \times \text{Predom} \rightarrow \text{Predom}.$$

$$(\pi_0)_{P, P'} \in [P \times P' \rightarrow_c P]$$

$$(\pi_0)_{P, P'}(a, b) = a.$$

exercise. Show that  $\text{unit}$  and  $\pi_0$  are indeed natural transformations.

exercise.  $\pi_1, m_{j_0}, m_{j_2}$  are also natural transformations if we pick appropriate functors. Find such functors.

⑨ Notice that all of  $\text{unit}$ ,  $\pi_0$ ,  $\pi_1$ ,  $m_{j_0}$ ,  $m_{j_2}$  do something very straightforward intuitively. They don't do any clever tricks. Naturality condition says in a sense that a ~~natural~~ transformation doesn't do anything clever.

In more positive terms, it says that a natural transformation only performs canonical operations.
